

Coding Challenge

Problem Statement

Build a Burger Builder Application where users can create a burger by adding or removing slices. Each slice has a price and the total burger price must update dynamically based on the slices selected and the quantity of burgers ordered.

The application must include a ReactJS frontend and a NodeJS backend. Orders must be stored in MongoDB Atlas.

The entire project should run using a single command.

The ReactJS application should exist inside the NodeJS project.

Burger Visualization

Render the burger visually as a stack of slices in the order they are added.

Example representation:

```
===== bread
----- aloo tikki
***** cheese
----- tomato
===== bread
```

Each slice type should have a distinct color or shape.

Slice Types and Prices

Slice	Price
Aloo Tikki	20
Paneer	25
Cheese	15
Tomato	10

Onion	10
Lettuce	8

Core Features

Users must be able to:

- Add slices
- Remove slices
- Reorder slices in the burger
- Change burger quantity
- View burger visualization updates in real time
- View total price update automatically

Structural Rules

1. Burger must start with a bread layer.
2. Burger must end with a bread layer.
3. Bread cannot appear in the middle.
4. Maximum 10 slices per burger.

Price Calculation

Total Price = (Sum of slice prices × Quantity) + Platform Fee

Conditional Pricing Rules

- Cheese and Paneer together → discount of 3.
- Two consecutive Aloo Tikki slices → extra charge of 2.
- If burger has more than 6 slices, display:

Chef suggests splitting this burger into two burgers

Checkout

Users must enter:

- Customer Name
- Mobile Number
- Address
- UPI/cash/COD/Net Banking

Add Validations

Cart should display:

Burger configuration
Slice stack
Burger quantity
Total price
Address
